

# ABSTRACT OF THE DISCLOSURE

5           A multi-scanner scans a signal according to  
several different patterns.   A scanning pattern  
selector determines which scanning pattern produced  
the most efficient coding result, for example, for  
runlength coding, and outputs a coded signal, coded  
most efficiently, and a selection signal which  
10           identifies the scanning pattern found to be most  
efficient.
